

Group data into bins to increase clarity of the trend and reduce the effects of outliers.

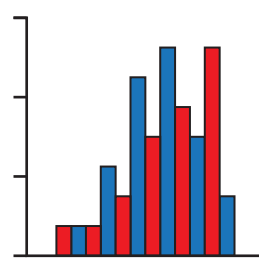

Have at least five bins. This allows meaningful conclusions about a dataset.

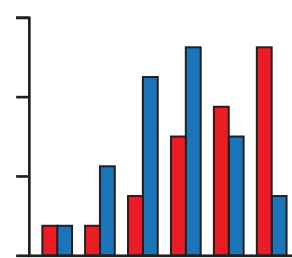

If the histogram represents a single dataset, use the same color for all bins.

Don't use spacing between bars on a histogram as you would on a bar chart.

Use spacing between bars if there are two or more datasets plotted on the same histogram.

Often, a better solution is to overlay one of the histograms with its outline only.
